3. Social Cognition without Mindreading. By the early 21 st century, the primacy that both TT and ST assigns to mindreading in social cognition had been challenged. One line of attack has come from philosophers working in the phenomenological tradition, such as Shaun Gallagher, Matthew Ratcliffe, and Dan Zahavi (see Gallagher & Zahavi 2008).

The LHPA Axis and Childhood Trauma. Exposure to severe stress and trauma in youth can disrupt the regulatory processes of the LHPA axis across the life span in both animals and humans [26, 27, 34-36]. In animals, injections of CRF in early life produces a delayed effect in later life that is associated with reduced cognitive function, reduced number of number of CA3 hippocampal neurons, and ...

Vygotsky’s Theory. In Vygotsky’s (1934/1987) theory of cognitive development, inner speech is the outcome of a developmental process. Vygotsky assumed that understanding how such a phenomenon emerges over the life span is necessary for full comprehension of its subjective qualities and functional characteristics.

This finding encourages us to continue with a theoretical framework (Leslie, 1984, to appear) which can specify the underlying connections between pretend play, theory of mind and social skills. Deriving further testable predictions from such a model may lead to a new approach to the cognitive dysfunction in childhood autism (Frith, 1984).
